

NEW BOLTON CENTER MRI

Penn Vet's New Bolton Center now offers a MRI system designed specifically for obtaining high-quality images in horses.

The O-Scan is a high-resolution MRI system for diagnostic imaging that uses a low-field magnet. The MRI is capable of imaging extremities, from the foot to the hock (tarsus) or knee (carpus). The system, manufactured by Esaote, also can be used to evaluate the limbs of other large animals.

The MRI is used primarily for soft-tissue injuries associated with lameness, but detects bone injury as well. It provides physiologic information in addition to anatomic data.

Magnetic resonance imaging (MRI) is a technique that uses a magnetic field and radio waves to create detailed images of the organs and tissues within the body. MRI provides additional information beyond radiography, computed tomography (CT), and ultrasonography.

The following studies are available:

- Foot, Pastern
Single-limb imaging of this region includes limited images of the opposite limb, if clinically indicated
- Proximal suspensory
Single-limb imaging of this region includes limited images of the opposite limb, if clinically indicated
- Fetlock, Bilateral fetlock
- Carpus, Bilateral carpus
- Tarsus, Bilateral tarsus

All images will be reviewed by the clinician on the case, as well as a board-certified radiologist, with reports available within 24 hours.

Pricing 2018

Cost includes a two-night stay at New Bolton Center, general anesthesia, the MRI scan, a report by a board-certified radiologist, as well as all other associated supply costs.

- Foot (including mandatory metal check): \$3,000
- Bilateral Feet (including mandatory metal check): \$4,500
- Other Single Body Part: \$2,800
- Other Bilateral Body Parts: \$4,300

Appointments

Appointments are available Monday through Friday, and can be made by contacting 610.925.6125 or 610.925.6140.
